

```
/*
 * Please see our documentation for full
details:
 *
 *
https://ifttt.com/developers/docs/testing
 *
 * What is this?
 *
 * This JSON document should provide
samples for trigger and action fields and,
 * if required, a valid user access token
corresponding to a test user on your
 * service. We will use this data to
automatically test your integration.
 *
 * We have generated the scaffold for
you. Please tweak as necessary.
 *
 * Where do I put this?
 *
 * This should be returned by your API at
the following endpoint:
 *
https://SkinPhoniqa.beezer.com/ifttt/v1/test/s
etup
 *
 * `accessToken` (OAuth only)
 *
 * This should be a valid access token
that corresponds to a user on your service.
 *
 * `triggers`
 *
 * For all triggers that have trigger
fields, provide a set of valid values for
 * those trigger fields. These will be
used in requests to verify that trigger
 * endpoints respond appropriately.
 *
 * `triggerFieldValidations`
 *
 * For all triggers with dynamic
validators, provide a valid example and an
invalid example.
 *
 * `actions`
 *
 * For all actions, provide a set of
valid values for each action field.
 *
 * `actionRecordSkipping`
 *
 * If you have implemented record-
skipping for your action, you can optionally
 * provide test inputs that cause your
action endpoint to return a record-skip
response.
 *
 * We highly recommend you implement
record-skipping. Please see more info here:
 *
https://ifttt.com/developers/docs/api\_referenc
e#skipping-records
